# STM8L051F3

Value Line, 8-bit ultralow power MCU, 8-KB Flash, 256-byte data EEPROM, RTC, timers, USART, I2C, SPI, ADC

Datasheet − production data

Features

- Operating conditions
    - Operating power supply: 1.8 V to 3.6 V
      Temperature range: −40 °C to 85 °C
- Low power features
    - 5 low power modes: Wait, Low power run (5.1 µA), Low power wait (3 µA), Active-halt with RTC (1.3 µA), Halt (350 nA)
    - Ultra-low leakage per I/0: 50 nA
    - Fast wakeup from Halt: 5 µs
- Advanced STM8 core
    - Harvard architecture and 3-stage pipeline
    - Max freq: 16 MHz, 16 CISC MIPS peak
    - Up to 40 external interrupt sources
- Reset and supply management
    - Low power, ultra-safe BOR reset with 5 selectable thresholds
    - Ultra low power POR/PDR
    - Programmable voltage detector (PVD)
- Clock management
    - 32 kHz and 1 to 16 MHz crystal oscillators
    - Internal 16 MHz factory-trimmed RC
    - Internal 38 kHz low consumption RC
    - Clock security system
- Low power RTC
    - BCD calendar with alarm interrupt
    - Digital calibration with +/- 0.5 ppm accuracy
    - LSE security system
    - Auto-wakeup from Halt w/ periodic interrupt
- Memories
    - 8 Kbytes of Flash program memory and 256 bytes of data EEPROM with ECC
    - Flexible write and read protection modes
    - 1 Kbyte of RAM

TSSOP20
- DMA
    - 4 channels supporting ADC, SPI, I2C, USART, timers
    - 1 channel for memory-to-memory
- 12-bit ADC up to 1 Msps/28 channels
    - Internal reference voltage
- Timers
    - Two 16-bit timers with 2 channels (used as IC, OC, PWM), quadrature encoder
    - One 8-bit timer with 7-bit prescaler
    - 2 watchdogs: 1 Window, 1 Independent
    - Beeper timer with 1, 2 or 4 kHz frequencies
- Communication interfaces
    - Synchronous serial interface (SPI)
    - Fast I^2C 400 kHz SMBus and PMBus
    - USART
- Up to 18 I/Os, all mappable on interrupt vectors
- Development support
    - Fast on-chip programming and non-intrusive debugging with SWIM
    - Bootloader using USART

1 Introduction

This document describes the features, pinout, mechanical data and ordering information for the low density value line STM8L051F3 microcontroller with 8-Kbyte Flash memory density.

For further details on the whole STMicroelectronics low density family please refer to *Section 2.2: Ultra low power continuum*.

For detailed information on device operation and registers, refer to the reference manual (RM0031).

For information on to the Flash program memory and data EEPROM, refer to the programming manual (PM0054).

For information on the debug module and SWIM (single wire interface module), refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).

For information on the STM8 core, refer to the STM8 CPU programming manual (PM0044).

Low density value line devices provide the following benefits:

● Integrated system
  – 8 Kbytes of low-density embedded Flash program memory
  – 256 bytes of data EEPROM
  – 1 Kbyte of RAM
  – Internal high-speed and low-power low speed RC
  – Embedded reset
● Ultra low power consumption
  – 1 µA in Active-halt mode
  – Clock gated system and optimized power management
  – Capability to execute from RAM for Low power wait mode and Low power run mode
● Advanced features
  – Up to 16 MIPS at 16 MHz CPU clock frequency
  – Direct memory access (DMA) for memory-to-memory or peripheral-to-memory access
● Short development cycles
  – Application scalability across a common family product architecture with compatible pinout, memory map and modular peripherals
  – Wide choice of development tools

These features make the value line STM8L05xxx ultra low power microcontroller family suitable for a wide range of consumer and mass market applications.

Refer to *Table 1: Low density value line STM8L05xxx low power device features and peripheral counts* and *Section 3: Functional overview* for an overview of the complete range of peripherals proposed in this family.

Figure 1 shows the block diagram of the low density value line STM8L05xxx family.

2 Description

The low density value line STM8L05xxx devices are members of the STM8L ultra low power 8-bit family.

The value line STM8L05xxx ultra low power family features an enhanced STM8 CPU core providing increased processing power (up to 16 MIPS at 16 MHz) while maintaining the advantages of a CISC architecture with improved code density, a 24-bit linear addressing space and an optimized architecture for low power operations.

The family includes an integrated debug module with a hardware interface (SWIM) which allows non-intrusive In-Application debugging and ultra-fast Flash programming.

Low density value line STM8L05xxx microcontrollers feature embedded data EEPROM and low power, low-voltage, single-supply program Flash memory.

The devices incorporate an extensive range of enhanced I/Os and peripherals, a 12-bit ADC, a real-time clock, two 16-bit timers, one 8-bit timer, as well as standard communication interfaces such as an SPI, an I^2C interface, and one USART.

The modular design of the peripheral set allows the same peripherals to be found in different ST microcontroller families including 32-bit families. This makes any transition to a different family very easy, and simplified even more by the use of a common set of development tools.

All value line STM8L ultra low power products are based on the same architecture with the same memory mapping and a coherent pinout.

CPU frequency		16 MHz
Operating voltage		1.8 to 3.6 V
Operating temperature		− 40 to +85 °C
Package		TSSOP20

1. The number of GPIOs given in this table includes the NRST/PA1 pin but the application can use the NRST/PA1 pin as general purpose output only (PA1).

2.2   Ultra low power continuum

The ultra low power value line STM8L05xxx and STM8L15xxx are fully pin-to-pin, software and feature compatible. Besides the full compatibility within the STM8L family, the devices are part of STMicroelectronics microcontrollers ultra low power strategy which also includes STM8L101xx and STM32L15xxx. The STM8L and STM32L families allow a continuum of performance, peripherals, system architecture, and features.

They are all based on STMicroelectronics 0.13 µm ultra-low leakage process.

Note: 1   The STM8L05xxx are pin-to-pin compatible with STM8L101xx devices.

2   The STM32L family is pin-to-pin compatible with the general purpose STM32F family. Please refer to STM32L15x documentation for more information on these devices.

Performance

All families incorporate highly energy-efficient cores with both Harvard architecture and pipelined execution: advanced STM8 core for STM8L families and ARM Cortex™-M3 core for STM32L family. In addition specific care for the design architecture has been taken to optimize the mA/DMIPS and mA/MHz ratios.

This allows the ultra low power performance to range from 5 up to 33.3 DMIPs.

Shared peripherals

STM8L05xx, STM8L15xx and STM32L15xx share identical peripherals which ensure a very easy migration from one family to another:

● Analog peripheral: ADC1
● Digital peripherals: RTC and some communication interfaces

Common system strategy

To offer flexibility and optimize performance, the STM8L and STM32L devices use a common architecture:

● Same power supply range from 1.8 to 3.6 V
● Architecture optimized to reach ultra low consumption both in low power modes and Run mode
● Fast startup strategy from low power modes
● Flexible system clock
● Ultra-safe reset: same reset strategy for both STM8L and STM32L including power-on reset, power-down reset, brownout reset and programmable voltage detector.

Features

ST ultra low power continuum also lies in feature compatibility:

● More than 10 packages with pin count from 20 to 100 pins and size down to 3 x 3 mm
● Memory density ranging from 4 to 128 Kbytes

3.1 Low power modes

The low density value line STM8L05xxx devices support five low power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

● **Wait mode**: The CPU clock is stopped, but selected peripherals keep running. An internal or external interrupt or a Reset can be used to exit the microcontroller from Wait mode (WFE or WFI mode).

● **Low power run mode**: The CPU and the selected peripherals are running. Execution is done from RAM with a low speed oscillator (LSI or LSE). Flash memory and data EEPROM are stopped and the voltage regulator is configured in ultra low power mode. The microcontroller enters Low power run mode by software and can exit from this mode by software or by a reset.
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode.

● **Low power wait mode:** This mode is entered when executing a Wait for event in Low power run mode. It is similar to Low power run mode except that the CPU clock is stopped. The wakeup from this mode is triggered by a Reset or by an internal or external event (peripheral event generated by the timers, serial interfaces, DMA controller (DMA1) and I/O ports). When the wakeup is triggered by an event, the system goes back to Low power run mode.
All interrupts must be masked. They cannot be used to exit the microcontroller from this mode.

● **Active-halt mode**: CPU and peripheral clocks are stopped, except RTC. The wakeup can be triggered by RTC interrupts, external interrupts or reset.

● **Halt mode**: CPU and peripheral clocks are stopped, the device remains powered on. The RAM content is preserved. The wakeup is triggered by an external interrupt or reset. A few peripherals have also a wakeup from Halt capability. Switching off the internal reference voltage reduces power consumption. Through software configuration it is also possible to wake up the device without waiting for the internal reference voltage wakeup time to have a fast wakeup time of 5 µs.

3.2 Central processing unit STM8

3.2.1 Advanced STM8 Core

The 8-bit STM8 core is designed for code efficiency and performance with an Harvard architecture and a 3-stage pipeline.

It contains 6 internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing, and 80 instructions.

Architecture and registers

● Harvard architecture

● 3-stage pipeline

● 32-bit wide program memory bus - single cycle fetching most instructions

● X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations

● 8-bit accumulator

● 24-bit program counter - 16-Mbyte linear memory space

● 16-bit stack pointer - access to a 64-Kbyte level stack

● 8-bit condition code register - 7 condition flags for the result of the last instruction

Addressing

● 20 addressing modes

● Indexed indirect addressing mode for lookup tables located anywhere in the address space

● Stack pointer relative addressing mode for local variables and parameter passing

Instruction set

● 80 instructions with 2-byte average instruction size

● Standard data movement and logic/arithmetic functions

● 8-bit by 8-bit multiplication

● 16-bit by 8-bit and 16-bit by 16-bit division

● Bit manipulation

● Data transfer between stack and accumulator (push/pop) with direct stack access

● Data transfer using the X and Y registers or direct memory-to-memory transfers

3.2.2 Interrupt controller

The low density value line STM8L05xxx features a nested vectored interrupt controller:

● Nested interrupts with 3 software priority levels

● 32 interrupt vectors with hardware priority

● Up to 17 external interrupt sources on 11 vectors

● Trap and reset interrupts

3.3 Reset and supply management

3.3.1 Power supply scheme

The device requires a 1.8 V to 3.6 V operating supply voltage (V_{DD}). The external power supply pins must be connected as follows:

- V_{SS1}; V_{DD1} = 1.8 to 3.6 V: external power supply for I/Os and for the internal regulator. Provided externally through V_{DD1} pins, the corresponding ground pin is V_{SS1}.

- V_{SSA}; V_{DDA} = 1.8 to 3.6 V: external power supplies for analog peripherals. V_{DDA} and V_{SSA} must be connected to V_{DD1} and V_{SS1}, respectively.

- V_{SS2}; V_{DD2} = 1.8 to 3.6 V: external power supplies for I/Os. V_{DD2} and V_{SS2} must be connected to V_{DD1} and V_{SS1}, respectively.

- V_{REF+}, V_{REF-} (for ADC1): external reference voltage for ADC1. Must be provided externally through V_{REF+} and V_{REF-} pin.

3.3.2 Power supply supervisor

The device has an integrated ZEROPOWER power-on reset (POR)/power-down reset (PDR), coupled with a brownout reset (BOR) circuitry. When the microcontroller operates between 1.8 and 3.6 V, BOR is always active and ensures proper operation starting from 1.8 V. After the 1.8 V BOR threshold is reached, the option byte loading process starts, either to confirm or modify default thresholds, or to disable BOR permanently.

Five BOR thresholds are available through option bytes, starting from 1.8 V to 3 V. To reduce the power consumption in Halt mode, it is possible to automatically switch off the internal reference voltage (and consequently the BOR) in Halt mode. The device remains in reset state when V_{DD} is below a specified threshold, $V_{POR/PDR}$ or V_{BOR}, without the need for any external reset circuit.

The device features an embedded programmable voltage detector (PVD) that monitors the V_{DD}/V_{DDA} power supply and compares it to the V_{PVD} threshold. This PVD offers 7 different levels between 1.85 V and 3.05 V, chosen by software, with a step around 200 mV. An interrupt can be generated when V_{DD}/V_{DDA} drops below the V_{PVD} threshold and/or when V_{DD}/V_{DDA} is higher than the V_{PVD} threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software.

3.3.3 Voltage regulator

The low density value line STM8L05xxx embeds an internal voltage regulator for generating the 1.8 V power supply for the core and peripherals.

This regulator has two different modes:

- Main voltage regulator mode (MVR) for Run, Wait for interrupt (WFI) and Wait for event (WFE) modes.

- Low power voltage regulator mode (LPVR) for Halt, Active-halt, Low power run and Low power wait modes.

When entering Halt or Active-halt modes, the system automatically switches from the MVR to the LPVR in order to reduce current consumption.

3.4 Clock management

The clock controller distributes the system clock (SYSCLK) coming from different oscillators to the core and the peripherals. It also manages clock gating for low power modes and ensures clock robustness.

Features

● **Clock prescaler:** to get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.

● **Safe clock switching:** Clock sources can be changed safely on the fly in run mode through a configuration register.

● **Clock management:** To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.

● **System clock sources:** four different clock sources can be used to drive the system clock:
  – 1-16 MHz High speed external crystal (HSE)
  – 16 MHz High speed internal RC oscillator (HSI)
  – 32.768 Low speed external crystal (LSE)
  – 38 kHz Low speed internal RC (LSI)

● **RTC clock sources:** the above four sources can be chosen to clock the RTC whatever the system clock.

● **Startup clock:** After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.

● **Clock security system (CSS):** This feature can be enabled by software. If a HSE clock failure occurs, it is automatically switched to HSI.

● **Configurable main clock output (CCO):** This outputs an external clock for use by the application.

Figure 2.   Low density value line STM8L05xxx clock tree diagram
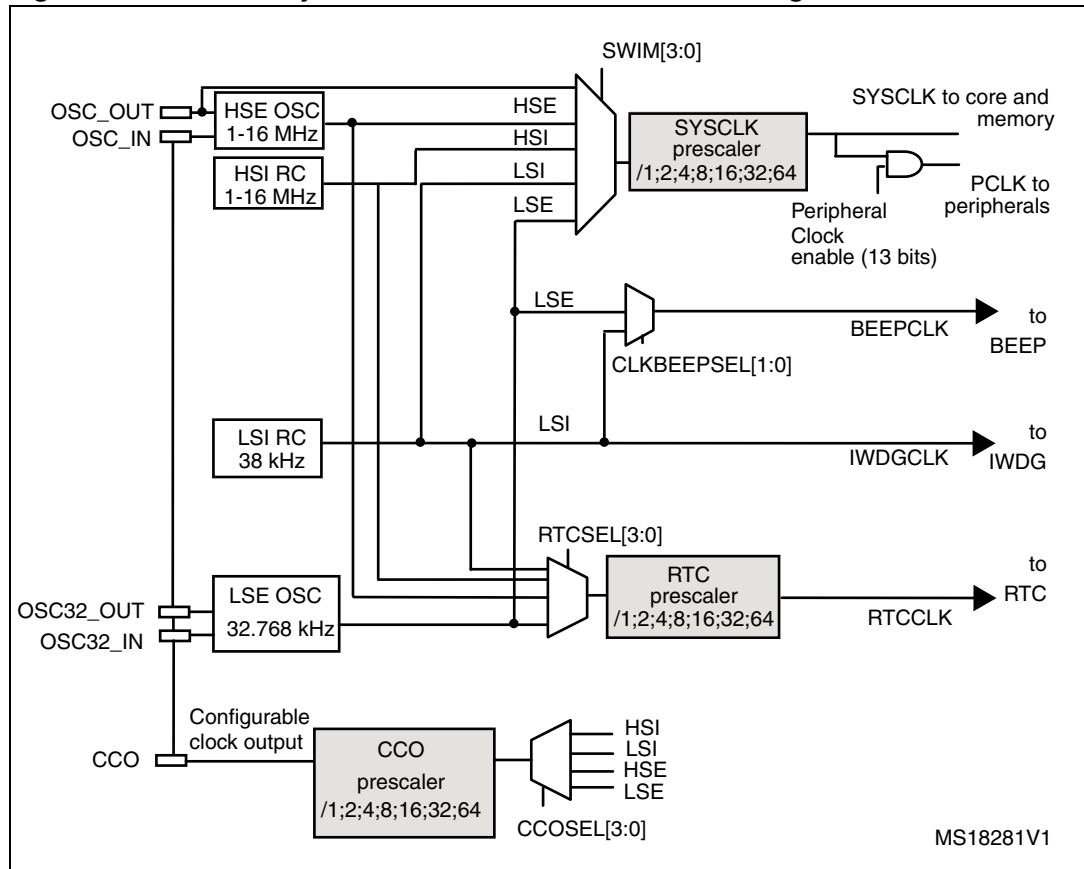

1. The HSE clock source can be either an external crystal/ceramic resonator or an external source (HSE bypass). Refer to Section HSE clock in the STM8L15x and STM8L16x reference manual (RM0031).

2. The LSE clock source can be either an external crystal/ceramic resonator or a external source (LSE bypass). Refer to Section LSE clock in the STM8L15x and STM8L16x reference manual (RM0031).

3.5 Low power real-time clock

The real-time clock (RTC) is an independent binary coded decimal (BCD) timer/counter.

Six byte locations contain the second, minute, hour (12/24 hour), week day, date, month, year, in BCD (binary coded decimal) format. Correction for 28, 29 (leap year), 30, and 31 day months are made automatically.

It provides a programmable alarm and programmable periodic interrupts with wakeup from Halt capability.

● Periodic wakeup time using the 32.768 kHz LSE with the lowest resolution (of 61 µs) is from min. 122 µs to max. 3.9 s. With a different resolution, the wakeup time can reach 36 hours

● Periodic alarms based on the calendar can also be generated from every second to every year

3.6 Memories

The low density value line STM8L05xxx devices have the following main features:

● Up to 1 Kbyte of RAM
● The non-volatile memory is divided into three arrays:
  – 8 Kbytes of low-density embedded Flash program memory
  – 256 bytes of Data EEPROM
  – Option bytes

The EEPROM embeds the error correction code (ECC) feature.

The option byte protects part of the Flash program memory from write and readout piracy.

3.7 DMA

A 4-channel direct memory access controller (DMA1) offers a memory-to-memory and peripherals-from/to-memory transfer capability. The 4 channels are shared between the following IPs with DMA capability: ADC1, I2C1, SPI1, USART1, and the three timers.

3.8 Analog-to-digital converter

● 12-bit analog-to-digital converter (ADC1) with 10 channels (including 1 fast channel) and internal reference voltage
● Conversion time down to 1 µs with f_{SYSCLK}= 16 MHz
● Programmable resolution
● Programmable sampling time
● Single and continuous mode of conversion
● Scan capability: automatic conversion performed on a selected group of analog inputs
● Analog watchdog
● Triggered by timer

Note: *ADC1 can be served by DMA1.*

3.9 System configuration controller and routing interface

The system configuration controller provides the capability to remap some alternate functions on different I/O ports. TIM4 and ADC1 DMA channels can also be remapped.

The highly flexible routing interface controls the routing of internal analog signals to ADC1 and the internal reference voltage V_{REFINT}.

3.10 Timers

Low density value line STM8L05xxx devices contain two 16-bit general purpose timers (TIM2 and TIM3) and one 8-bit basic timer (TIM4).

All the timers can be served by DMA1.

Table 2 compares the features of the advanced control, general-purpose and basic timers.

Table 2. Timer feature comparison

Timer	Counter resolution	Counter type	Prescaler factor	DMA1 request generation	Capture/compare channels	Complementary outputs
TIM2	16-bit	up/down	Any power of 2 from 1 to 128	Yes	2	None
TIM3						
TIM4	8-bit	up	Any power of 2 from 1 to 32768		0	

3.10.1 16-bit general purpose timers (TIM2, TIM3)

● 16-bit autoreload (AR) up/down-counter

● 7-bit prescaler adjustable to fixed power of 2 ratios (1…128)

● 2 individually configurable capture/compare channels

● PWM mode

● Interrupt capability on various events (capture, compare, overflow, break, trigger)

● Synchronization with other timers or external signals (external clock, reset, trigger and enable)

3.10.2 8-bit basic timer (TIM4)

The 8-bit timer consists of an 8-bit up auto-reload counter driven by a programmable prescaler. It can be used for timebase generation with interrupt generation on timer overflow.

3.11 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

3.11.1 Window watchdog timer

The window watchdog (WWDG) is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

3.11.2 Independent watchdog timer

The independent watchdog peripheral (IWDG) can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the internal LSI RC clock source, and thus stays active even in case of a CPU clock failure.

3.12 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

3.13 Communication interfaces

3.13.1 SPI

The serial peripheral interfaces (SPI1) provide half/ full duplex synchronous serial communication with external devices.

● Maximum speed: 8 Mbit/s (f_{SYSCLK}/2) both for master and slave
● Full duplex synchronous transfers
● Simplex synchronous transfers on 2 lines with a possible bidirectional data line
● Master or slave operation - selectable by hardware or software
● Hardware CRC calculation
● Slave/master selection input pin

Note: SPI1 can be served by the DMA1 Controller.

3.13.2 I²C

The I²C bus interface (I2C1) provides multi-master capability, and controls all I²C bus-specific sequencing, protocol, arbitration and timing.

● Master, slave and multi-master capability
● Standard mode up to 100 kHz and fast speed modes up to 400 kHz
● 7-bit and 10-bit addressing modes
● SMBus 2.0 and PMBus support
● Hardware CRC calculation

Note: I²C1 can be served by the DMA1 Controller.

3.13.3 USART

The USART interface (USART1) allows full duplex, asynchronous communications with external devices requiring an industry standard NRZ asynchronous serial data format. It offers a very wide range of baud rates.

- 1 Mbit/s full duplex SCI
- SPI1 emulation
- High precision baud rate generator
- Smartcard emulation
- IrDA SIR encoder decoder
- Single wire half duplex mode

Note: *USART1 can be served by the DMA1 Controller.*

3.14 Infrared (IR) interface

The low density STM8L05xxx devices contain an infrared interface which can be used with an IR LED for remote control functions. Two timer output compare channels are used to generate the infrared remote control signals.

3.15 Development support

Development tools

Development tools for the STM8 microcontrollers include:

- The STice emulation system offering tracing and code profiling
- The STVD high-level language debugger including C compiler, assembler and integrated development environment
- The STVP Flash programming software

The STM8 also comes with starter kits, evaluation boards and low-cost in-circuit debugging/programming tools.

Single wire data interface (SWIM) and debug module

The debug module with its single wire data interface (SWIM) permits non-intrusive real-time in-circuit debugging and fast memory programming.

The Single wire interface is used for direct access to the debugging module and memory programming. The interface can be activated in all device operation modes.

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, CPU operation can also be monitored in real-time by means of shadow registers.

Bootloader

The low density value line STM8L05xxx ultra low power devices feature a built-in bootloader (see *UM0560: STM8 bootloader user manual*).

The bootloader is used to download application software into the device memories, including RAM, program and data memory, using standard serial interfaces. It is a complementary solution to programming via the SWIM debugging interface.

1. At power-up, the PA1/NRST pin is a reset input pin with pull-up. To be used as a general purpose pin (PA1), it can be configured only as output open-drain or push-pull, not as a general purpose input. Refer to Section *Configuring NRST/PA1 pin as general purpose output* in the STM8L15xxx and STM8L16xxx reference manual (RM0031).

2. [ ] Alternate function remapping option (if the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).

3. A pull-up is applied to PB0 and PB4 during the reset phase. These two pins are input floating after reset release.

4. In the open-drain output column, 'T' defines a true open-drain I/O (P-buffer and protection diode to V_{DD} are not implemented).

5. The PA0 pin is in input pull-up during the reset phase and after reset release.

6. High Sink LED driver capability available on PA0.

Note: *The slope control of all GPIO pins, except true open drain pins, can be programmed. By default, the slope control is limited to 2 MHz.*

4.1   System configuration options

As shown in *Table 4: Low density value line STM8L05xxx pin description*, some alternate functions can be remapped on different I/O ports by programming one of the two remapping registers described in the "Routing interface (RI) and system configuration controller" section in the STM8L15xxx and STM8L16xxx reference manual (RM0031).

5 Memory and register map

5.1 Memory mapping

The memory map is shown in *Figure 4*.

Figure 4. Memory map
1. *Table 5* lists the boundary addresses for each memory size. The top of the stack is at the RAM end address.

2. Refer to *Table 7* for an overview of hardware register mapping, to *Table 6* for details on I/O port hardware registers, and to *Table 8* for information on CPU/SWIM/debug module controller registers.

1. The Low power wait mode is entered when executing a WFE instruction in Low power run mode. In WFE mode, the interrupt is served if it has been previously enabled. After processing the interrupt, the processor goes back to WFE mode. When the interrupt is configured as a wakeup event, the CPU wakes up and resumes processing.

2. The TLI interrupt is the logic OR between TIM2 overflow interrupt, and TIM4 overflow interrupts.

3. The device is woken up from Halt or Active-halt mode only when the address received matches the interface address.

7 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated memory block.

All option bytes can be modified in ICP mode (with SWIM) by accessing the EEPROM address. See *Table 10* for details on option byte addresses.

The option bytes can also be modified 'on the fly' by the application in IAP mode, except for the ROP and UBC values which can only be taken into account when they are modified in ICP mode (with the SWIM).

Refer to the STM8L05x/15x Flash programming manual (PM0054) and STM8 SWIM and Debug Manual (UM0470) for information on SWIM programming procedures.

Table 11.   Option byte description

Option byte No.	Option description

OPT0	**ROP[7:0]** Memory readout protection (ROP)
	   0xAA: Disable readout protection (write access via SWIM protocol)
	   Refer to Readout protection section in the STM8L05x/15x and STM8L16x reference manual (RM0031).

OPT1	**UBC[7:0]** Size of the user boot code area
	   0x00: UBC is not protected.
	   0x01: Page 0 is write protected.
	   0x02: Page 0 and 1 reserved for the UBC and write protected. It covers only the interrupt vectors.
	   0x03: Page 0 to 2 reserved for UBC and write protected.
	   0x7F to 0xFF - All 128 pages reserved for UBC and write protected.
	   The protection of the memory area not protected by the UBC is enabled through the MASS keys.
	   Refer to User boot code section in the STM8L05x/15x and STM8L16x reference manual (RM0031).

OPT2	Reserved

OPT3	**IWDG_HW:** Independent watchdog
	   0: Independent watchdog activated by software
	   1: Independent watchdog activated by hardware
	
	IWDG_HALT: Independent window watchdog off on Halt/Active-halt
	   0: Independent watchdog continues running in Halt/Active-halt mode
	   1: Independent watchdog stopped in Halt/Active-halt mode
	
	WWDG_HW: Window watchdog
	   0: Window watchdog activated by software
	   1: Window watchdog activated by hardware
	
	WWDG_HALT: Window window watchdog reset on Halt/Active-halt
	   0: Window watchdog stopped in Halt mode
	   1: Window watchdog generates a reset when MCU enters Halt mode

OPT4	**HSECNT**: Number of HSE oscillator stabilization clock cycles
	   0x00 - 1 clock cycle
	   0x01 - 16 clock cycles
	   0x10 - 512 clock cycles
	   0x11 - 4096 clock cycles
	
	LSECNT: Number of LSE oscillator stabilization clock cycles
	   0x00 - 1 clock cycle
	   0x01 - 16 clock cycles
	   0x10 - 512 clock cycles
	   0x11 - 4096 clock cycles
	Refer to *Table 29: LSE oscillator characteristics on page 62*.

Table 11. Option byte description (continued)

Option byte No.	Option description
OPT5	**BOR_ON**: 0: Brownout reset off 1: Brownout reset on
	BOR_TH[3:1]: Brownout reset thresholds. Refer to *Table 20* for details on the thresholds according to the value of BOR_TH bits.
OPTBL	**OPTBL[15:0]**: This option is checked by the boot ROM code after reset. Depending on content of addresses 00 480B, 00 480C and 0x8000 (reset vector) the CPU jumps to the bootloader or to the reset vector. Refer to the UM0560 bootloader user manual for more details.

8 Electrical parameters

8.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS}.

8.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at T_A= 25 °C and T_A = T_A max (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics is indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean±3Σ).

8.1.2 Typical values

Unless otherwise specified, typical data is based on T_A = 25 °C, V_{DD} = 3 V. It is given only as design guidelines and is not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean±2Σ).
8.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

8.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in *Figure 5*.

Figure 5.   Pin loading conditions

8.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in *Figure 6*.

Figure 6. Pin input voltage

8.2 Absolute maximum ratings

Stresses above those listed as "absolute maximum ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 12. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
V_{DD}- V_{SS}	External supply voltage (including V_{DDA} and V_{DD2})[1]	- 0.3	4.0	V
V_{IN}[2]	Input voltage on true open-drain pins (PC0 and PC1)	V_{SS} - 0.3	V_{DD} + 4.0	V
	Input voltage on five-volt tolerant (FT) pins (PA7 and PE0)	V_{SS} - 0.3	V_{DD} + 4.0	
	Input voltage on 3.6 V tolerant (TT) pins	V_{SS} - 0.3	4.0	
	Input voltage on any other pin	V_{SS} - 0.3	4.0	
V_{ESD}	Electrostatic discharge voltage	see *Absolute maximum ratings (electrical sensitivity) on page 87*		

1. All power (V_{DD1}, V_{DD2}, V_{DDA}) and ground (V_{SS1}, V_{SS2}, V_{SSA}) pins must always be connected to the external power supply.

2. V_{IN} maximum must always be respected. Refer to *Table 13.* for maximum allowed injected current values.

Table 13.   Current characteristics

Symbol	Ratings	Max.	Unit
I_{VDD}	Total current into V_{DD} power line (source)	80	mA
I_{VSS}	Total current out of V_{SS} ground line (sink)	80	
I_{IO}	Output current sunk by IR_TIM pin (with high sink LED driver capability)	80	
	Output current sunk by any other I/O and control pin	25	
	Output current sourced by any I/Os and control pin	- 25	
$I_{INJ(PIN)}$	Injected current on true open-drain pins (PC0 and PC1)[1]	- 5 / +0	
	Injected current on five-volt tolerant (FT) pins (PA7 and PE0) [1]	- 5 / +0	
	Injected current on 3.6 V tolerant (TT) pins [1]	- 5 / +0	
	Injected current on any other pin [2]	- 5 / +5	
$\Sigma I_{INJ(PIN)}$	Total injected current (sum of all I/O and control pins) [3]	± 25	

1. Positive injection is not possible on these I/Os. A negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ(PIN)}$ must never be exceeded. Refer to *Table 12.* for maximum allowed input voltage values.

2.   A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. $I_{INJ(PIN)}$ must never be exceeded. Refer to *Table 12.* for maximum allowed input voltage values.

3. When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 14.   Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	-65 to +150	° C
T_J	Maximum junction temperature	150	

8.3 Operating conditions

Subject to general operating conditions for V_{DD} and T_A.

8.3.1 General operating conditions

Table 15. General operating conditions

Symbol	Parameter	Conditions	Min.	Max.	Unit
f_{SYSCLK}[1]	System clock frequency	$1.8\ V \leq V_{DD} < 3.6\ V$	0	16	MHz
V_{DD}	Standard operating voltage		1.8	3.6	V
V_{DDA}	Analog operating voltage	Must be at the same potential as V_{DD}	1.8	3.6	V
P_D[2]	Power dissipation at T_A= 85 °C	TSSOP20		181	mW
T_A	Temperature range	$1.8\ V \leq V_{DD} < 3.6\ V$	-40	85	°C
T_J	Junction temperature range	$-40\ °C \leq T_A < 85\ °C$	-40	105[3]	°C

1. $f_{SYSCLK} = f_{CPU}$

2. To calculate $P_{Dmax}(T_A)$, use the formula $P_{Dmax}=(T_{Jmax} -T_A)/\Theta_{JA}$ with T_{Jmax} in this table and Θ_{JA} in "Thermal characteristics" table.

3. T_{Jmax} is given by the test limit. Above this value, the product behavior is not guaranteed.

### 8.3.2 Embedded reset and power control block characteristics

Table 16. Embedded reset and power control block characteristics

Total current consumption

The MCU is placed under the following conditions:

● All I/O pins in input mode with a static value at V_{DD} or V_{SS} (no load)

● All peripherals are disabled except if explicitly mentioned.

In the following table, data is based on characterization results, unless otherwise specified.

Subject to general operating conditions for V_{DD} and T_A.

### HSE crystal/ceramic resonator oscillator

The HSE clock can be supplied with a 1 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

g_m	Oscillator transconductance		3.5[3]			mA/V
$t_{SU(HSE)}$[4]	Startup time	V_{DD} is stabilized		1		ms

1. $C=C_{L1}=C_{L2}$ is approximately equivalent to 2 x crystal C_{LOAD}.

2. The oscillator selection can be optimized in terms of supply current using a high quality resonator with small R_m value. Refer to crystal manufacturer for more details

3. Data guaranteed by Design. Not tested in production.

4. $t_{SU(HSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 16 MHz oscillation. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Figure 12.   HSE oscillator circuit diagram

HSE oscillator critical g_m formula

$$g_{mcrit} = (2 \times \Pi \times f_{HSE})^2 \times R_m(2Co + C)^2$$

R_m: Motional resistance (see crystal specification), L_m: Motional inductance (see crystal specification),
C_m: Motional capacitance (see crystal specification), Co: Shunt capacitance (see crystal specification),
$C_{L1}=C_{L2}=C$: Grounded external capacitance
$g_m >> g_{mcrit}$

$t_{su(HSI)}$	HSI oscillator setup time (wakeup time)			3.7	6[4]	µs
$I_{DD(HSI)}$	HSI oscillator power consumption			100	140[4]	µA

1. V_{DD} = 3.0 V, T_A = -40 to 85 °C unless otherwise specified.

2. Tested in production.

3. The trimming step differs depending on the trimming code. It is usually negative on the codes which are multiples of 16 (0x00, 0x10, 0x20, 0x30...0xE0). Refer to the AN3101 "STM8L15x internal RC oscillator calibration" application note for more details.

4. Guaranteed by design, not tested in production.

1. Data based on characterization results, not tested in production.

2. Conforming to JEDEC JESD22a117

3. The physical granularity of the memory is 4 bytes, so cycling is performed on 4 bytes even when a write/erase operation addresses a single byte.

4. Data based on characterization performed on the whole data memory.

8.3.6 I/O current injection characteristics

As a general rule, current injection to the I/O pins, due to external voltage below V_{SS} or above V_{DD} (for standard pins) should be avoided during normal product operation. However, in order to give an indication of the robustness of the microcontroller in cases when abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during device characterization.

Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out of range parameter: ADC error, out of spec current injection on adjacent pins or other functional failure (for example reset, oscillator frequency deviation, LCD levels, etc.).

The test results are given in the following table.

Table 34.   I/O current injection susceptibility

Symbol	Description	Functional susceptibility		Unit
		Negative injection	Positive injection	
I_{INJ}	Injected current on true open-drain pins (PC0 and PC1)	-5	+0	mA
	Injected current on all five-volt tolerant (FT) pins	-5	+0	
	Injected current on all 3.6 V tolerant (TT) pins	-5	+0	
	Injected current on any other pin	-5	+5	

8.3.7   I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Figure 27.   Typical NRST pull-up current I$_{pu}$ vs. V$_{DD}$

The reset network shown in *Figure 28* protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below the V$_{IL(NRST)}$ max. level specified in *Table 39*. Otherwise the reset is not taken into account internally.

For power consumption sensitive applications, the external reset capacitor value can be reduced to limit the charge/discharge current. If the NRST signal is used to reset the external circuitry, attention must be paid to the charge/discharge time of the external capacitor to fulfill the external devices reset timing conditions. The minimum recommended capacity is 10 nF.

1. Parameters are given by selecting 10 MHz I/O output frequency.

2. Values based on design simulation and/or characterization results, and not tested in production.

3. Min time is for the minimum time to drive the output and max time is for the maximum time to validate the data.

4. Min time is for the minimum time to invalidate the output and max time is for the maximum time to put the data in Hi-Z.

I^{2}C - Inter IC control interface

Subject to general operating conditions for V_{DD}, f_{SYSCLK}, and T_A unless otherwise specified.

The STM8L I^{2}C interface (I2C1) meets the requirements of the Standard I^{2}C communication protocol described in the following table with the restriction mentioned below:

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (SDA and SCL).

1. f_{SYSCLK} must be at least equal to 8 MHz to achieve max fast I^{2}C speed (400 kHz).

2. Data based on standard I^{2}C protocol requirement, not tested in production.

Note: *For speeds around 200 kHz, the achieved speed can have a ± 5% tolerance*
          For other speed ranges, the achieved speed can have a ± 2% tolerance
          The above variations depend on the accuracy of the external components used.

1. The current consumption through V_{REF} is composed of two parameters:
   - one constant (max 300 µA)
   - one variable (max 400 µA), only during sampling time + 2 first conversion pulses.
   So, peak consumption is 300+400 = 700 µA and average consumption is 300 + [(4 sampling + 2) /16] x 400 = 450 µA at 1Msps

2. V_{REF-} or V_{DDA} must be tied to ground.

3. Guaranteed by design, not tested in production.

4. Minimum sampling and conversion time is reached for maximum Rext = 0.5 kΩ.

5. Value obtained for continuous conversion on fast channel.

6. The time between 2 conversions, or between ADC ON and the first conversion must be lower than t_{IDLE}.

7. The t_{IDLE} maximum value is ∞ on the "Z" revision code of the device.

In the following three tables, data is guaranteed by characterization result, not tested in production.

1. Refer to *Table 43* for the values of R_{AIN} and C_{ADC}.

2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high $C_{parasitic}$ value will downgrade conversion accuracy. To remedy this, f_{ADC} should be reduced.

General PCB design guidelines

Power supply decoupling should be performed as shown in *Figure 36* or *Figure 37*, depending on whether V_{REF+} is connected to V_{DDA} or not. Good quality ceramic 10 nF capacitors should be used. They should be placed as close as possible to the chip.

8.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

Functional EMS (electromagnetic susceptibility)

Based on a simple running application on the product (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

● **ESD**: Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000 standard.

● **FTB**: A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Table 48.   EMS data

Symbol	Parameter	Conditions		Level/Class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V_{DD} = 3.3 V, T_A = +25 °C, f_{CPU}= 16 MHz, conforms to IEC 61000		3B
V_{EFTB}	Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance	V_{DD} = 3.3 V, T_A = +25 °C, f_{CPU} = 16 MHz, conforms to IEC 61000	Using HSI	4A
			Using HSE	2B

Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling 2 LEDs through the I/O ports), the product is monitored in terms of emission. This emission test is in line with the norm IEC61967-2 which specifies the board and the loading of each pin.

Table 49. EMI data [1]

Symbol	Parameter	Conditions	Monitored frequency band	Max vs. 16 MHz	Unit

Absolute maximum ratings (electrical sensitivity)

Based on two different tests (ESD and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin). Two models can be simulated: human body model and charge device model. This test conforms to the JESD22-A114A/A115A standard.

Table 50. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Maximum value [1]	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (human body model)	T_A = +25 °C	2000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (charge device model)		500

Static latch-up

● **LU**: 3 complementary static tests are required on 6 parts to assess the latch-up performance. A supply overvoltage (applied to each power supply pin) and a current injection (applied to each input, output and configurable I/O pin) are performed on each sample. This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

9.3 Thermal characteristics

The maximum chip junction temperature (T_{Jmax}) must never exceed the values given in *Table 15: General operating conditions on page 48*.

The maximum chip-junction temperature, T_{Jmax}, in degree Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- T_{Amax} is the maximum ambient temperature in °C

- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W

- P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)

- P_{INTmax} is the product of I_{DD} and V_{DD}, expressed in Watts. This is the maximum chip internal power.

- $P_{I/Omax}$ represents the maximum power dissipation on output pins
  Where:
  $P_{I/Omax} = \Sigma (V_{OL} * I_{OL}) + \Sigma((V_{DD} - V_{OH}) * I_{OH})$,
  taking into account the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.
